## I. INTRODUCTION

## 1. ADOPTION OF THE NEW METRIC CARAT

The carat weights in use previous to July 1, 1913, in different countries had differed greatly, scarcely any two of the important countries having the same standard. Even within the United States there was not agreement in the standard used, the various makers of weights using slightly different standards. This led to considerable confusion in the weighing of gems, and was the more serious because of the great value of the article.

Beginning July 1, 1913, the international metric carat of 200 milligrams as the unit of weight for diamonds and other precious stones was put into commercial use in the United States by practically all the dealers in gems and precious stones through the efforts of a committee representing all the principal firms handling gems. On the same date the Treasury Department of the United States Government also began the use of this unit in the customs service for the levying of import duties on precious stones, and the Bureau of Standards recognized this unit for purposes of certification of all carat weights submitted to the Bureau for test.

The movement for the adoption of a uniform, decimally divided standard was a decided step forward and therefore has met with success. The new metric carat of 200 milligrams is universally used in the United States and has been officially adopted by Belgium, Bulgaria, Denmark, England, France, Germany, Holland, Italy, Japan, Norway, Portugal, Roumania, Spain, Sweden, and Switzerland. The Bureau of Standards in 1913 prepared tables for converting "old" carats to new metric carats, and vice versa, and published them as Circular No. 43. These tables were of great aid at the time to the transition from the old unit of about 205.3 milligrams and binary fractions to the new unit and decimal fractions.

# 2. PROPOSED ADOPTION OF THE METRIC SYSTEM

The inconvenience and inefficient use of the present system of pennyweights and grains as opposed to the benefits derived from the use of the new metric decimally divided carat has become so pronounced that the Bureau was invited to prepare a practical working outline of the metric system that would suit the needs of the jewelry trade and allied industries. The purpose of this is to make it easily possible for jewelers and silversmiths to substitute the gram for the dual unit of pennyweights and grains <sup>2</sup> and also to use the metric system in all of their work.

<sup>&</sup>lt;sup>2</sup> It is desirable to note in this connection that all medical prescriptions of the U. S. Army must be expressed in metric units, not in grains.

The Bureau therefore is publishing this circular giving tables of the relations between the customary units and the corresponding ones of the metric system. There is also given information that is of interest to other branches of the jewelry trade, such as the comparative table for the diameters corresponding to the sizes of watches.

With this edition, the material on the metric carat has been revised, and, because of the large amount of new material which has been added to the publication, the title has been changed.

## II. THE METRIC SYSTEM

#### 1. DESCRIPTION

## (a) LEGAL STATUS

The metric system was rendered legal for all transactions in the United States by an act of Congress, approved July 28, 1866, and is now legal or obligatory in all commercial countries. Many industries in the United States are using it. In Europe, and also in many other parts of the world, more measurements are made in metric terms than in any other system. The metric system must be understood by those who deal intelligently with their customers in the metric countries.

# (b) GENERAL OUTLINE

The meter for measuring length, the liter for measuring capacity, and the gram for weight form the basis of the metric system. These units, together with the multiples and subdivisions given in the following table,<sup>3</sup> are sufficient for practical purposes and are recognized in all countries.

er onier Eller s	Correct English spelling	Standard abbre- viations
	10 millimeters—1 centimeter	10 mm=1 cm
Length	100 centimeters=1 meter	100 cm =1 m
	1000 meters = 1 kilometer	1000 m = 1 km
Capacity	1000 milliliters =1 liter	1000 ml = 11
	[1000 milligrams = 1 gram	1000 mg =1 g
Weight	1000 grams = 1 kilogram.	1000 g =1 kg
	1000 kilograms =1 metric ton	

<sup>&</sup>lt;sup>3</sup> Additional units, multiples, and subdivisions, which may be needed occasionally, are given later under "Definitions of Units," pp. 11 to 14.

Tables giving the interrelation of units of measurement may be found in Bureau Circular No. 47.

Complete metric tables are formed by combining the words "METER," "LITER," and "GRAM" with the six numerical prefixes as in the following tables:

Prefixes	Meaning		Units
milli- = one-thou.	sandth 1000	.001	
centi- = one-hund	dredth 100	.01	"meter" for
deci- = one-tent	h 10	.1	
Unit = one		1	"liter" for ca-
deka- = ten	10	10	pacity
hecto- = one hun	dred 100 1	100	"gram" for weight or
kilo- = one thor	usand $\frac{1000}{1}$ 1	1000	mass

The metric unit of length for jewelers and silversmiths is the millimeter, or one-thousandth of a meter: the millimeter is the size of the smallest space shown in Fig. 1. It is also very nearly the diameter of a No. 18 wire of American (Brown & Sharpe) wire gage. For very small values of length, such as the thickness of the plating on an electroplated article, it is convenient to use the "micron," which is one-thousandth of a millimeter. The smallest subdivision on the head of a micrometer with a millimeter screw usually is o.o. millimeter, or 10 microns. In working material to a given dimension within a quarter of a thousandth of an inch, the accuracy obtained is 6 microns. An inch equals almost exactly 25.4 millimeters.

The liter is the standard unit of capacity and is divided into a thousand equal parts called milliliters. For ordinary purposes, the liter is equivalent to a

<sup>&</sup>lt;sup>4</sup> There is a minute distinction between the liter and 1000 cubic centimeters which is used only in work of extreme precision. See "Fundamental Relationship," page 9.

cubic measure 10 centimeters on each edge, or 1000 cubic centimeters. A liter is a trifle larger than a U. S. liquid quart.

The gram is the unit of mass (or weight); 1000 grams make a kilogram. The kilogram is exactly the mass of a liter of water when at the temperature of 4° C (39.2° F). The gram is frequently subdivided into 1000 parts called milligrams. For a small article (less than 1 gram) the weight usually is expressed in milligrams. A piece of platinum wire one-half inch long and American (B. & S.) wire gage No. 30 weighs about 14 milligrams; if of copper wire it weighs about 6 milligrams. A one-half carat diamond weighs exactly 100 milligrams. For large weighings, or in expressing the sum of several weighings, it is convenient to use the gram even up to about 10 000 grams, or 10 kilograms, thus avoiding the change from one unit to another. In the metric system a quantity is always expressed in terms of only one unit. The gram equals about 15.4 grains, and the kilogram is about 2.2 avoirdupois pounds.

A change to a larger or smaller metric measure of length, area, volume, capacity, or weight is effected by merely multiplying or dividing by 10 or a multiple of 10. This enables those who use the metric system to make accurate mental and written calculations with a rapidity which would otherwise be impossible.

# (c) FUNDAMENTAL RELATIONSHIPS

The tables in this circular have been prepared to aid in changing values from one system of weights and measures to another. The U. S. units are referred to except when otherwise indicated. The tables have been based upon the following equivalents:

39.37 United States inches

= 1 meter

I United States gallon

=231 cubic inches

ı liter

=1000.027 cubic centimeters

1 United States avoirdupois pound=0.4535924277 kilogram

The values in most of the tables have been expressed with the accuracy usually required at the bench. In some cases, however, many figures are given for use in connection with precise work. Equivalents, such as those in the tables given on pages 15, 20, 21, and 22, should be used only to the required degree of accuracy. For example, in Table 2, page 15, it is stated that 4 inches are equal to 10.16002 centimeters. This may be rounded off, giving 4 inches equal to 10.2 centimeters, or, if less accuracy is desired, the approximate value of 10 centimeters may be used.

#### (d) SPELLING AND ABBREVIATION OF UNITS

The spelling of the names of metric units is that given in the law of July 28, 1866, legalizing the metric system in the United States.

The following principles of abbreviation have been adopted by the Bureau in conformity with international agreement.

- 1. The period is omitted after the abbreviations of the metric units, while it is used after those of the customary system.
  - 2. The same abbreviation is used for both singular and plural.
- 3. Unless all of the text is printed in capital letters, only small letters are used for abbreviations (except in the case of A. for acre, where the use of the capital letter is general).
- 4. The exponents "2" and "3" following abbreviations of units of length, are used to signify area and volume, respectively, in the case of the metric units instead of the longer prefixes "sq." and "cu." In conformity with this principle the abbreviation for cubic centimeter is "cm³" in preference to any other usual practice.

(e) SPECIAL WAYS TO USE THE TABLES

When the tables do not give the equivalent of any desired quantity directly and completely, the equivalent can usually be obtained without the necessity of making a multiplication. This is done by using quantities from different parts of the same table or from several tables, making a shift of decimal points if necessary, and merely adding the results. For example:

1. Convert 27.3 millimeters into inches. (Refer to Table 1, p. 15.)

```
2 mm=0.07874 inch, hence 20.0 mm=0.7874 inch
7.0 mm= .27559 inch
3 mm= .11811 inch, hence 3 mm= .01181 inch
27.3 mm=1.0748 inches
```

2. Convert 1.0748 inches into millimeters. (Refer to Table 1, p. 15.)

```
p. 15.)

1 inch

7 inches=177.8 mm, hence o. o7 inch = 1.778 mm
4 inches=101.6 mm, hence o. 04 inch = 1.02 mm
8 inches=203.2 mm, hence o. 008 inch = 020 mm

1.0748 inches=27.300 mm
```

3. Convert 253 pennyweights 13.5 grains into grams.

```
      200 pennyweights (Table 34, p. 24)
      = 311. 035 g

      53 pennyweights (Table 34, p. 24)
      = 82. 424 g

      13 grains (Table 32, p. 23)
      = .842 g

      5 grains=0.324 g, hence 0.5 grain
      = .032 g

      253 pennyweights 13.5 grains
      = 394. 333 g
```

#### 2. DEFINITIONS OF UNITS

#### Fundamental Units

#### (a) LENGTH

A METER (m) is a unit of length equivalent to the distance between the defining lines on the international prototype meter at the International Bureau of Weights and Measures when this standard is at the temperature of melting ice (o° C).

A YARD (yd.) is a unit of length equivalent to \(\frac{3600}{3937}\) of a meter.

# Multiples and Submultiples

- 1 kilometer (km) = 1000 meters.
- 1 hectometer (hm) = 100 meters.
- 1 dekameter (dkm) = 10 meters.
- 1 decimeter (dm) = 0.1 meter.
- i centimeter (cm) = 0.01 meter.
- 1 millimeter (mm) = 0.001 meter = 0.1 centimeter.
- ı micron  $(\mu) = 0.000001$  meter = 0.001 millimeter.
- I millimicron  $(m\mu) = 0.000000001$  meter = 0.001 micron.
- I foot (ft.) =  $\frac{1}{3}$  yard =  $\frac{1200}{3937}$  meter.
- I inch (in.) =  $\frac{1}{36}$  yard =  $\frac{1}{12}$  foot =  $\frac{100}{3937}$  meter.
- 1 link (li.) = 0.22 yard = 7.92 inches.
- $1 \text{ rod (rd.)} = 5\frac{1}{2} \text{ yards} = 16\frac{1}{2} \text{ feet.}$
- 1 chain (ch.) = 22 yards = 100 links = 66 feet = 4 rods.
- 1 furlong (fur.) = 220 yards = 40 rods = 10 chains.
- I statute mile (mi.) = 1760 yards = 5280 feet = 320 rods.
- I hand = 4 inches.
- 1 point (printers') =  $\frac{1}{72}$  inch (approximately).
- I point (silversmiths') =  $\frac{1}{4000}$  inch.
- 1 mil=0.001 inch.
- I fathom = 6 feet.
- I span = 9 inches =  $\frac{1}{8}$  fathom.
- 1 nautical mile

United States = 6080.20 feet = 1.151553

sea mile statute miles = 1853.249 meters.

(b) AREA

# Fundamental Units

A square meter  $(m^2)$  is a unit of area equivalent to the area of a square the sides of which are 1 meter.

A SQUARE YARD (sq. yd.) is a unit of area equivalent to the area of a square the sides of which are I yard.

# Multiples and Submultiples

- I square kilometer (km²) = I 000 000 square meters.
- I hectare (ha), or square hectometer (hm²) = 10 000 square meters.
- 1 are (a), or square dekameter (dkm²) = 100 square meters.
- I centare (ca) = I square meter.
- 1 square decimeter (dm²) = 0.01 square meter.
- 1 square centimeter (cm²) = 0.0001 square meter.
- I square millimeter (mm²) = 0.000001 square meter = 0.01 square centimeter.
- r square foot (sq. ft.) =  $\frac{1}{9}$  square yard.
- I square inch (sq. in.) =  $\frac{1}{1296}$  square yard =  $\frac{1}{144}$  square foot.
- ı square link (sq. li.) =0.0484 square yard =62.7264 square inches
- 1 square rod (sq. rd.) = 30.25 square yards = 272.25 square feet = 625 square links.
- 1 square chain (sq. ch.) = 484 square yards = 16 square rods = 100 000 square links.
- 1 acre (A.) = 4840 square yards = 160 square rods = 10
  square chains.
- r square mile (sq. mi.) = 3 og 7 600 square yards = 640 acres.

# Fundamental Units (c) VOLUME

A CUBIC METER (m³) is a unit of volume equivalent to a cube the edges of which are 1 meter.

A CUBIC YARD (cu. yd.) is a unit of volume equivalent to a cube the edges of which are I yard.

# Multiples and Submultiples

- 1 cubic kilometer (km³) = 1 000 000 000 cubic meters.
- I cubic hectometer (hm³) = I 000 000 cubic meters.
- 1 cubic dekameter (dkm³) = 1000 cubic meters.
- 1 stere (s) = 1 cubic meter.
- 1 cubic decimeter (dm³) = 0.001 cubic meter.
- I cubic centimeter (cm³) = 0.000001 cubic meter = 0.001 cubic decimeter.
- I cubic millimeter (mm³) = 0.000000001 cubic meter = 0.001 cubic centimeter.
- ı cubic foot (cu. ft.) =  $\frac{1}{27}$  cubic yard.
- I cubic inch (cu. in.) =  $\frac{1}{46656}$  cubic yard =  $\frac{1}{1728}$  cubic foot.
- 1 board foot = 144 cubic inches =  $\frac{1}{12}$  cubic foot.
- 1 cord (cd.) = 128 cubic feet.

### (d) CAPACITY

#### Fundamental Units

- A LITER (I) is a unit of capacity equivalent to the volume occupied by the mass of 1 kilogram of pure water at its maximum density (at a temperature of 4° C, practically) and under the standard atmospheric pressure (of 760 mm). It is equivalent in volume to 1.000027 cubic decimeters.
- A GALLON (gal.) is a unit of capacity equivalent to the volume of 231 cubic inches. It is used for the measurement of liquid commodities only.
- A BUSHEL (bu.) is a unit of capacity equivalent to the volume of 2150.42 cubic inches. It is used in the measurement of dry commodities only.<sup>5</sup>

# Multiples and Submultiples

- 1 hectoliter (hl) = 100 liters.
- I dekaliter (dkl) = 10 liters.
- ı deciliter (dl) = o.ı liter.
- 1 centiliter (cl) = 0.01 liter.
- 1 milliliter (ml) = 0.001 liter = 1.000027 cubic centimeters.
- 1 liquid quart (liq. qt.) =  $\frac{1}{4}$  gallon = 57.75 cubic inches.
- I liquid pint (liq. pt.) = ½ gallon = ½ liquid quart = 28.875 cubic inches.
- 1 gill (gi.) =  $\frac{1}{32}$  gallon =  $\frac{1}{4}$  liquid pint = 7.21875 cubic inches.
- I fluid ounce (fl. oz.) =  $\frac{1}{128}$  gallon =  $\frac{1}{16}$  liquid pint.
- ı fluid dram (fl. dr.) =  $\frac{1}{8}$  fluid ounce =  $\frac{1}{128}$  liquid pint.
- I minim (min. or  $\mathfrak{m}$ ) =  $\frac{1}{60}$  fluid dram =  $\frac{1}{480}$  fluid ounce.
- 1 firkin = 9 gallons.
- 1 peck (pk.) =  $\frac{1}{4}$  bushel = 537.605 cubic inches.
- I dry quart (dry qt.) =  $\frac{1}{32}$  bushel =  $\frac{1}{8}$  peck = 67.200625 cubic inches.
- I dry pint (dry pt.) =  $\frac{1}{64}$  bushel =  $\frac{1}{2}$  dry quart = 33.6003125 cubic inches.
- i barrel (for fruit, vegetables, and other dry commodities) = 7056 cubic inches = 105 dry quarts.

<sup>&</sup>lt;sup>5</sup> The above bushel is the so-called stricken or struck bushel. Many dry commodities are sold by heaped bushel, which is generally specified in the State laws to be the usual stricken bushel measure "duly heaped in the form of a cone as high as the article will admit" or "heaped as high as may be without special effort or design." The heaped bushel was originally intended to be 25 per cent greater than the stricken bushel, <sup>6</sup> As fixed by United States statute, approved Mar. 4, 1915.

#### (e) MASS

## Fundamental Units

A KILOGRAM (kg) is a unit of mass equivalent to the mass of the international prototype kilogram at the International Bureau of Weights and Measures.

An avoirdupois pound (lb. av.) is a unit of mass equivalent to 0.4535924277 kilogram.

A GRAM (g) is a unit of mass equivalent to one-thousandth of the mass of the international prototype kilogram at the International Bureau of Weights and Measures.

A TROY POUND (lb. t.) is a unit of mass equivalent to \$7780 of that of the avoirdupois pound.

# Multiples and Submultiples

- 1 metric ton (t) = 1000 kilograms.
- 1 hectogram (hg) = 100 grams = 0.1 kilogram.
- ı dekagram (dkg) = 10 grams = 0.01 kilogram.
- ı decigram (dg) = o.1 gram.
- ı centigram (cg) = 0.01 gram.
- ı milligram (mg) = 0.001 gram.
- 1 avoirdupois ounce (oz. av.) =  $\frac{1}{16}$  avoirdupois pound.
- 1 avoirdupois dram (dr. av.) =  $\frac{1}{256}$  avoirdupois pound =  $\frac{1}{16}$  avoirdupois ounce.
- I grain (gr.) =  $\tau_{000}^{1}$  avoirdupois pound =  $\frac{10}{4375}$  avoirdupois ounce =  $\frac{10}{5160}$  troy pound.
- ı apothecaries' pound (lb. ap.) = ı troy pound =  $\frac{5.760}{70000}$  avoirdupois pound.
- 1 apothecaries' or troy ounce (oz. ap., or  $\frac{\pi}{3}$ , or oz. t.) =  $\frac{1}{12}$  troy pound =  $\frac{480}{1000}$  avoirdupois pound =  $\frac{480}{1000}$  grains.
- r apothecaries' dram (dr.ap. or  $\overline{3}$ ) =  $\frac{1}{9}$  apothecaries' pound =  $\frac{1}{6}$  apothecaries' ounce = 60 grains.
- 1 pennyweight (dwt.) =  $\frac{1}{20}$  troy ounce = 24 grains.
- r apothecaries' scruple (s. ap. or  $\mathfrak{D}$ ) =  $\frac{1}{3}$  apothecaries' dram = 20 grains.
- 1 metric carat (c) = 200 milligrams = 0.2 gram.
- 1 short hundredweight (sh. cwt.) = 100 avoirdupois pounds.
- 1 long hundredweight (1. cwt.) = 112 avoirdupois pounds.
- 1 short ton = 2000 avoirdupois pounds.
- 1 long ton = 2240 avoirdupois pounds.

a For the conversion of avoirdupois ounces to grams see Table 29.

# III. THE METRIC CARAT

The carat which had been in use prior to July 1, 1913, in the United States, while varying, has been nearer the value 205.3 mg than any other. This value has therefore been taken in making up the tables of equivalents given in this circular. The old carat has usually been subdivided on the binary system, the smallest subdivision used being usually one sixty-fourth of the carat. The equivalents in fractions of a carat in these tables are, therefore, given in sixty-fourths. One of the improvements introduced with the new carat of exactly 200 mg is the subdivision of it on the decimal system. The fractions of the new carat in these tables are accordingly given to hundredths of a carat.

### 2. CONVERSION TABLES

Tables 40 and 41 are for the conversion of quantities in the old unit to the equivalent weight in terms of the new metric carat. Table 40 is used for the conversion of fractions of a carat, while Table 41 gives the equivalent of each unit or whole carat from 1 to 100 of the old system in terms of new metric carats and hundredths of a carat. If it is desired to convert whole carats and fractions of a carat of the old unit to the new, the two tables can be used in combination; that is, by adding the quantities obtained from each, thus: Suppose it is desired to obtain the equivalent of  $28\frac{45}{15}$  old carats in terms of the metric carats:

From Table 40..  $\frac{45}{64}$  old carats = 0.72 metric carats From Table 41.. 28 old carats = 28.74 metric carats

Adding...  $28\frac{45}{64}$  old carats = 29.46 metric carats.

Or, if it is desired to convert a larger quantity involving several hundred or thousand carats, one uses the equivalents in the last column of Table 41 for each hundred and thousand of the old carats up to ten hundred and ten thousand—thus, to convert 3225\frac{3}{4} old carats to metric carats:

From Table 40.. \$\frac{3}{4}\$ old carats = 0.77 metric carats

From Table 41.. \$25\$ old carats = 25.66 metric carats

200 old carats = 205.30 metric carats

3000 old carats = 3079.50 metric carats

Adding...  $3225\frac{3}{4}$  old carats = 3311.23 metric carats.

# IV. GAGES<sup>7</sup> (WIRE AND DRILL) 1. EXISTING PRACTICE IN GAGING MATERIALS

The sizes of materials were for many years indicated in commercial practice almost entirely by gage numbers. This practice was accompanied by considerable confusion because numerous gages were in use. In general, gage sizes are used much less now than formerly.8

In so far as wire gages are now in use in the United States, the practice has been practically limited to the use of two gages. For iron plates, there is only one gage—viz, the "U. S. standard." For drills there are two, with an additional one for drill rod and steel wire. Finally, there are some special gages, including several music wire gages.

The trend of practice in the gaging of materials is increasingly toward the direct specification of the dimensions in decimal fractions of an inch or millimeter without the use of gage numbers. Numerous engineering societies have gone on record as in favor of the direct use of diameters. This is similar to the practice in Germany, France, and Italy, where sizes are specified directly by the diameter in millimeters.

<sup>&</sup>lt;sup>7</sup> This information about gages was gathered from the statements on the subject in the catalogues of manufacturers and in scientific literature, including B. S. Circular No. 31.

<sup>&</sup>lt;sup>8</sup> In an article written in 1887 (S. S. Wheeler, Elec. World, 10, p. 254; 1887), over 30 gages were described, 19 of which were wire gages.

#### 2. WIRE GAGES 9

Among the wire gages that have survived, two are used extensively in this country, viz, the "American wire gage" (Brown & Sharpe) and the "Steel wire gage" (variously called the "Washburn & Moen," "Roebling," and "American Steel & Wire Co.'s"). Three other gages are still used to some extent, viz, the "Stubs' steel wire gage," the "Birmingham wire gage" (Stubs), and the "Old English wire gage" (London). In England one wire gage has been made legal and is in use generally, viz, the "Standard wire gage." The diameters corresponding to the gage number of five of the general wire gages mentioned are given in both inches and in millimeters in Table 43.

#### (a) American wire gage

The American wire gage is frequently called the "Brown & Sharpe gage." Its sizes are not utterly arbitrary and the differences between successive diameters are more regular than those of other gages. It is the only wire gage now in use whose successive sizes are determined by a mathematical law. The law of geometrical progression on which the gage is based is that the ratio of any diameter to the next smaller is a constant number (1.1229322). It is derived from the fundamental definition of the gage, which is that size No. 4–0 shall be 0.4600 inch in diameter, size No. 36 shall be 0.0050 inch in diameter, and 38 intermediary sizes or diameters shall be formed by geometrical progression.

# (b) Steel wire gage

The "Steel wire gage" with a number of its sizes expressed only to the nearest thousandth of an inch, has been known as the Roebling gage. It was originally established about the year 1830, and was named after the Washburn & Moen Manufacturing Co. This company was later merged into the American Steel & Wire Co., which continued the use of the Washburn & Moen gage for steel wire, giving it the name "American Steel & Wire Co.'s gage."

# (c) Stubs' steel wire gage

The Stubs' steel wire gage has a somewhat limited use for tool steel wire and drill rods. This gage should not be confused with the Birmingham wire gage, which is sometimes known as Stubs'

<sup>9</sup> For a more complete discussion of wire gages, see B. S. Circular No. 31, Copper Wire Tables.
<sup>10</sup> The name "Steel wire gage" was suggested by the Bureau of Standards in its correspondence with various companies, and it met with practically unanimous approval. It was necessary to decide upon a name for this gage, and the three names which have been used for it in the past were all open to the objection that they were the names of particular companies. These companies have accepted the new name. The abbreviation of the name of the gage should be "Stl. W. G.," to distinguish it from "S. W. G.," the abbreviation for the (British) Standard wire gage. When it is necessary to distinguish the name of this gage from others which may be used for steel wire—e. g., the (British) Standard wire gage—it may be called the United States steel wire gage.

iron wire gage. The diameters of its sizes are very nearly identical with the diameters of the corresponding sizes of drill gages, as is shown in Tables 45, 46, and 47.

# (d) BIRMINGHAM WIRE GAGE

Of the various wire gages which have remained in use but are now nearly obsolete, the one most frequently mentioned is the Birmingham. Its steps are quite irregular. Some of the later gages were based on the Birmingham, and by the repeated copying of old specifications its use has persisted to some extent, both in England and the United States. In the past this gage held certain departmental sanction in the United States Government, but this sanction was removed in 1914.

## (e) STANDARD WIRE GAGE

The "Standard wire gage," otherwise known as the new British standard, the English legal standard, or the Imperial wire gage, is the legal standard of Great Britain for all wires, as fixed by order in Council, August 23, 1883. It was constructed by improving the Birmingham wire gage.

## (f) OLD ENGLISH OR LONDON GAGE

The Old English or London gage, the sizes of which differ very little from those of the Birmingham gage, has had considerable use in the past for brass and copper wires, and is now used to some extent in the drawing of brass wire for weaving. It is nearly obsolete.

## 3. TWIST DRILL AND STEEL WIRE GAGES

The confusion in the use of gages for twist drills, drill rod, and steel wire is a constant source of trouble. The differences between the diameters of the corresponding sizes of the various gages are very small, generally being less than 0.002 inch. In this field also, the manufacturers (of drills) are encouraging the direct use of diameters in place of specifying sizes by gage numbers. At the present time there are three gages in extensive use in this field. These are (1) the Stubs' steel wire gage, (2) the drill gage used by the Standard Tool Co., and (3) the drill gage used by various other leading manufacturers of twist drills. This latter gage is referred to in the tables which follow as "various manufacturers" but in other publications it is sometimes referred to as "manufacturers' standard."

All of these gages have 26 lettered sizes and 80 numbered sizes. The lettered sizes of all three gages are identical. (See Table 44.) For the numbered sizes, the Stubs' steel wire gage does not agree with either of the drill gages. For Nos. 1 to 60 (Table 45) the gage of the Standard Tool Co. agrees with the corresponding sizes

of the gage used by various other manufacturers; for sizes Nos. 61 to 80 (Tables 46 and 47) there are numerous, but small, differences. The Standard Tool Co. gage sizes were the original, which, for sizes 61 to 80, were changed by certain manufacturers. The old size numbers and diameters were retained by the Standard Tool Co., which, in turn, began to manufacture drills of the new diameters as determined by the modified gage numbers of the other manufacturers, but assigned them gage sizes by inserting so-called half-sizes into their own gage. The relationships between the diameters and the various gage sizes are shown in Table 47.

# 4. TABLES OF GAGE SIZES (INCHES AND MILLIMETERS)

# TABLE 42.—Douzième Calipera

<sup>&</sup>lt;sup>a</sup> This caliper must not be confused with the tenth-millimeter spring caliper, which is similar in appearance to the douzième caliper. For the graduation equivalents of the gage, or caliper, referred to by the various names of screw, point, or dial gage, using the values of "points" as used by silversmiths, or quarter-thousandths of an inch, see the first column of Table 6.

a The Steel wire gage is the same gage which has been known by the various names: "Washburn & Moen: "Roebling." and "American Steel & Wire Co's." Its abbreviation should be written "Stl. W. G." to distinguish it from "S. W. G." the usual abbreviation for the British) Standard wire gage.

The millimeter diameters given for the American wire gage were obtained by multiplying by 25.40005 the mathematically correct values in inches before the latter were rounded off in the fourth decimal place as shown in the second column of the table.

#### V. WATCH GLASSES

### 1. GAGE SIZES FOR WATCH GLASSES

The systems upon which the gaging of watch glasses is based are in need of revision. Most manufacturers and dealers are labeling their glasses with several sets of numbers, each set indicating the diameter according to some system of gaging, most of which are based upon some subdivision of the ligne.11 The most common of these units based upon the ligne is frequently referred to as "sixteenths," because in this system the fraction over an integral number of lignes is expressed in sixteenths. Some of these labels include systems of gaging which are practically, if not entirely, obsolete. On the other hand, several manufacturers use the metric system, the unit for diameters being the tenthmillimeter.

#### 2. REASONS FOR ADOPTION OF METRIC GAGE SIZES

The metric system of gaging is recommended for use in preference to the ligne and its division into sixteenths, for the following reasons:

- (a) The step, or change in diameter, between consecutive sizes in the tenth-millimeter system is less than the corresponding steps for glasses gaged by lignes and "sixteenths," thereby making it possible to secure a better fit in placing a glass into a watchcase.
- (b) Many watch glasses are manufactured in metric sizes and are sold in ligne sizes to satisfy the habits of the retail trade in the United States. On the continent of Europe metric sizes are used.
- (c) The ligne as a unit of length is obsolete except in a few industries, and among them it is falling into disuse: the millimeter is universal in most commercial countries.

#### 3. SPECIMEN LABELS

Fig. 2.-Specimen watch glass labels

In Fig. 2 there are shown two sample labels of watch glasses giving the diameters in tenth-millimeters and in lignes (frequently spoken of as sixteenths); the last number given on each of these labels indicates by gage number the free height under the center of the glass to the plane formed by the circumference or rim. (See Table 49, p. 37). The basis by which the height of a watch glass is gaged is that a flat glass is gage No. 10, and that for each unit distance of 0.4

millimeter in height, the gage number decreases by unity. This system of labeling is recommended by the Bureau of Standards as the most satisfactory for the present, at least so long as

the ligne sizes are used in appreciable quantities. The manufacturers would prefer that metric sizes be used exclusively, but it depends largely upon the retail establishments to simplify existing conditions.

<sup>11</sup> The origin of the ligne is from the old, now practically obsolete, French toise (fathom) as follows: 12 lignes=1 pouce, 12 pouce=1 pied, 6 pied=1 toise. The relation between the toise and meter is 1 toise=1.949990 meters. (Guillaume, "Unités et Étalons," page 64.)

### 4. INFLUENCE OF WATCHCASE DESIGN

The number of sizes of watch glasses which it is necessary for retail establishments to carry in stock is almost appalling. In the table of diameters given below (Table 48), there are 272 sizes shown, which apply to each of the various models. The Bureau desires to suggest that the number of necessary sizes can be eventually reduced about 50 per cent if watchcase manufacturers would confine themselves to the manufacture of cases requiring only glasses whose sizes are an integral number of millimeters; to provide for odd sizes resulting from inaccurate workmanship, there would be supplied about two tenth-millimeter sizes below and above each integral or whole millimeter size.

#### 5. CONVERSION TABLES

Table 48 is a conversion table for the reduction of diameters expressed in lignes into tenth-millimeter sizes. Table 49 gives the height of glasses in both millimeters and inches.

TABLE 48.—Diameter of Watch Glasses—Conversion of Lignes (16ths) into Tenth-millimeters

#### VI. SIZES OF WATCHES

Watch sizes are based upon the diameter of the pillar plate. Watch movements made on the continent of Europe have their diameters expressed either in millimeters or in lignes, the former method being somewhat uncommon. A watch movement made in the United States has its diameter expressed in terms of a certain "Size No." The diameter of the o-size watch is 1 5/30ths of an inch; the size number increases for each 30th of an inch. The diameter of a 12-size watch movement is therefore 47/30ths of an inch (1.567 inches, or 39.79 millimeters).

From the third column of Table 50 it is seen that an 18-ligne watch equals almost exactly a 13-size and that a 15-ligne equals very closely a 5-size. In connection with the most common sizes it is well to note that the diameter of a 16-size watch is nearest to 19 lignes, 12-size to 18 lignes, and 0-size to 13 lignes.

TABLE 50.—Watch Sizes

[Based upon the diameter of pillar plate. 1 ligne=2.2559 millimeters; 1 inch=25.40005 millimeters, Size No.-Number of thirtieths (30th's) of an inch in excess of 35 thirtieths (35/30) of an inch]

#### VII. RING SIZES

## 1. ORIGINAL STANDARD

The gages for finger rings that are in use in the United States are almost universally of the cone type, and are designated by two trade names. One is "F. E. Allen's"; the other is "U. S. Standard." Apparently the principle of a metal cone with graduations from 1 to 13 or 0 to 13 is the same on the two gages, the only apparent difference between the two being in the shape of the wooden handles. All attempts to find any printed statement as to what the dimensions of the various sizes are supposed to be, have been unsuccessful. The earliest known patent on the conical ring gage was obtained by F. E. Allen on February 3, 1874, U. S. Patent No. 146974. In this patent there is described quite accurately the conical gage with sizes 1 to 13, and quarter sizes, as is used to-day; there is also described the auxiliary scale on the side for showing the circumference for each of the various sizes. The dimensions of the sizes are not stated.

# 2. INTRODUCTION OF ERRORS

From the accurate description of the present gage in Allen's patent, it may be presumed, perhaps erroneously although probably correctly, that the scale of sizes now in use was well known and in use at that time. There probably also is little doubt but that the present gage sizes have descended from those in use at that time, but by what steps and intermediary process it is impossible to state. Differences in the sizes have likely been introduced by the adoption of a common commercial copy as a pattern or standard. In fact, a standard was once obtained in this manner. A manufacturing company in 1917 wrote to the Bureau of Standards stating that they had been making these gages for nearly 25 years and that "our standard was probably obtained from a commercial Allen ring gage and there appears to be considerable variations in the ring gages on the market."

#### 3. MANY SIMILAR STANDARDS

While there apparently is only one standard in use in the United States, in reality, because of the lack of specific dimensions and because of the errors introduced by the adoption of a common commercial article as a pattern, there are many, although similar, standards. One establishment recently purchased a considerable number of platinum blank rings from a certain well-known and highly advertised manufacturer. The ring blanks as delivered

tested out about one-quarter size smaller than the size ordered, and as can be readily understood, there is no means of recourse even though there had been a desire on the part of the purchaser to obtain it. From the gages examined in a few retail establishments in the same city, there were discovered differences corresponding to about a third of a size. Continued search in other cities may be expected to disclose much larger differences. Letters from one important manufacturer of ring gages state that the diameters they use corresponding to sizes 1 and 13 are 0.485 and 0.877 inch, respectively; from another, they are 0.491 and 0.877 inch, respectively. On the other hand, measurements obtained during one afternoon for gages in use in retail houses in one locality gave a range of values for size 1 from 0.480 to 0.491 inch, and for size 13 from 0.870 to 0.878 inch.

## 4. CONFUSION ALSO IN USE OF GAGE

Not only is there confusion in the ring sizes and standards but confusion also exists in the method of use of the gages. Some companies bring the top of the ring to the mark on the gage, others use the middle of the ring, while still others use the lower edge of the ring. These differences in the method of use are equivalent for broad rings to an appreciable part of a size, and serve to increase the differences between the various standards. The differences between the various gages for any one size are somewhat small in comparison with the latitude permissible in the retail trade, but for the jobbers and manufacturers it seems desirable, however, that the diameter used for each of the various sizes and the method of use of the gage should be identical.

## 5. OUTLINE OF THE PROBLEM

The figures given in the preceding paragraphs show approximately the dimensions of the gages in use as compared with those of the standards of two ring gage manufacturers. The Bureau of Standards intends to take up this problem by obtaining more complete information as to the dimensions of gages in different parts of the country, and with the cooperation of those fundamentally interested in this problem, it hopes to be able to select some values which best represent the average dimensions of existing standards.

## VIII. MISCELLANEOUS TABLES

## TABLE 51.—Decimal Equivalents of Gold Karats a

[The number of karats indicates the number of 24ths of pure gold in an alloy]

<sup>&</sup>lt;sup>a</sup> The spelling "karat" is in general use among jewelers to designate the gold karat (fineness of gold) and is consistent with the accepted abbreviation for this term, "K"; also, it affords a distinctive term as compared with "carat," which, abbreviated by "c" designates a unit of weight used in measuring precious stones.

#### 1. APPROXIMATE TEMPER-ATURES BY COLOR

The estimation of temperature by the color of a hot body is influenced by so many factors that it is attended with great uncertainties. The chart shown in Fig. 3, taken from Bullens' "Steel and Its Heat Treatment," page 369, is appended as a rough guide for such temperature estimation.
